Print name

Algorithms Problem Solving

Level 1

Print name

Definition

- ◆ This program uses a function to print a name on the screen.
- ◆ A function is a reusable block of code that performs a specific task. Here, the function `PrintName` receives a name as a parameter and displays it.

Explanation

- ◆ The function `PrintName` has one parameter of type `string` called `Name`.
- ◆ When `PrintName("Sara Alterkawi")` is called, the text `"Sara Alterkawi"` is passed to the `Name` parameter.
- ◆ The function then uses `cout` to display the name.

Steps in main()

1. Define the PrintName function.
2. Add a string parameter called Name.
3. Use cout to print the name.
4. Call PrintName() from main().
5. Pass "Sara Alterkawi" as the argument.

💡 Example

```
PrintName("Sara Alterkawi");
```

The function receives "Sara Alterkawi" as the value of Name and prints:

Your Name is: Sara Alterkawi.

➡ Result

The program displays the name surrounded by asterisks.

Note

◆ Name is the parameter, while "Sara Alterkawi" is the argument passed to the function.

✦✦ Summary

- ✓ A function can receive data through parameters.
- ✓ The string argument is passed to the Name parameter.
- ✓ PrintName() displays the received name on the screen.

Thank you 😊
