Read & Print Name

Algorithms Problem Solving

Level 1

Read & Print Name

Definition

◆ This program reads the user's name from the keyboard and then prints it on the screen using two separate functions.

Explanation

- ◆ The program uses two functions:
- ◆ `ReadName()` reads the user's name using `getline()` and returns it as a string.
- ◆ `PrintName()` receives the name as a parameter and prints it.
- ◆ In `main()`, `ReadName()` is called inside `PrintName()`:
- ◆ `PrintName(ReadName());`
- ◆ This means `ReadName()` runs first, returns the entered name, and that returned value is passed directly to `PrintName()`.

Steps in main()

1. Call ReadName() from inside PrintName().
2. Read the user's name using getline().
3. Return the entered name from ReadName().
4. Pass the returned name to PrintName().
5. Print the name on the screen.

💡 Example

If the user enters:

Sara Alterkawi

ReadName() returns:

Sara Alterkawi

Then PrintName() receives it and prints:

Your Name is: Sara Alterkawi.

➡ Result

The program reads the user's full name and prints it using two separate functions.

Note

◆ `getline(cin, Name)` reads the entire line, including spaces, so it can read a full name such as "Sara Alterkawi".

✦✦ Summary

- ✓ ReadName() reads and returns the user's name.
- ✓ PrintName() receives the returned name and displays it.
- ✓ One function's return value can be used directly as another function's argument.

Thank you 😊
