

Computer Foundations Level 2

The background of the slide features a complex, abstract network of thin, dark lines crisscrossing the entire frame, resembling a web or a dense circuit board. In the lower portion of the image, there are dark silhouettes of several people, some standing and some leaning over, suggesting a collaborative work environment or a meeting. The overall color palette is dark and monochromatic, with the text providing the primary points of contrast.

JSON

JavaScript Object Notation

What is JSON?

Java**S**cript **O**bject **N**otation (**JSON**) is a lightweight data-interchange format. It is easy for humans to read and write. It is easy for machines to parse and generate.

- JSON is a lightweight data-interchange format.
- JSON is used to send data between computers.
- JSON is a text format.
- JSON for storing and transporting data.
- JSON is "self-describing" and easy to understand.
- JSON is language independent.

JSON Simplifies Things:

- JSON simplifies data sharing.
- JSON simplifies data transport.
- JSON simplifies platform changes.
- JSON simplifies data availability.

JSON stores data in plain text format. This provides a software- and hardware-independent way of storing, transporting, and sharing data.

XML

VS

JSON

```
<People>
  <person>
    <name>Mohammed Abu-Hadhoud</name>
    <age>46</age>
    <city>Amman</city>
    <country>Jordan</country>
  </person>

  <person>
    <name> Ali Ahmad</name>
    <age>30</age>
    <city>Cairo</city>
    <country>Egypt</country>
  </person>
</People>
```

```
{
  "People": {
    "person": [
      {
        "name": "Mohammed Abu-Hadhoud",
        "age": "46",
        "city": "Amman",
        "country": "Jordan"
      },
      {
        "name": "Ali Ahmad",
        "age": "30",
        "city": "Cairo",
        "country": "Egypt"
      }
    ]
  }
}
```

JSON VS XML

Main difference between JSON and XML:

- **JSON** supports numbers, strings, objects, Booleans, and arrays.
- **XML** supports all **JSON** types plus extra ones (Boolean variations, dates, images, namespaces).
- **JSON** is smaller in size and faster to transmit.
- **XML** uses more complex tags, making files larger and harder to read.

Thank you 😊
