GUID

What is GUID?

Globally **U**nique **I**dentifier (**GUID**) also known as UUID (Universally Unique Identifier), is a 128-bit value that is used to uniquely identify objects or entities. It is designed to be globally unique across all devices and systems.

- A GUID consists of five groups of characters, typically represented as a string of hexadecimal digits separated by hyphens. For example, a GUID may look like this:

6F9619FF- 8B86-D011-B42D-00C04F964FF

Example

```
Namespace GUID_Sample_In_Csharp
{
    internal class Program
    {
        static void Main(string[] args)
        {
            for (int i=1;i<=10;i++)
            {
                Guid GuidNumber = Guid.NewGuid();
                Console.WriteLine(GuidNumber);
            }
            Console.ReadKey();
        }
    }
}
```

Thank you 😊
