

The background is a blurred image of a computer monitor. It shows a dark-themed code editor with various lines of code in different colors (blue, green, white). At the bottom, a Windows taskbar is visible with several application icons including Chrome, Photoshop, and others. The overall image is out of focus, serving as a backdrop for the text.

C#

Level 1

Formatted String

C#

Level 1

Formatted String

Definition

- ◆ A formatted string in *C#* allows you to insert values into a string using placeholders such as `{0}`, `{1}`, `{2}`, etc.
- ◆ The values are provided after the string and are inserted into the corresponding placeholders.

Explanation

- ◆ The basic syntax is:

```
Console.WriteLine("Text {0} {1}", value1, value2);
```

- ◆ Each placeholder represents a value:

 `{0}` → first value

 `{1}` → second value

 `{2}` → third value

- ◆ The numbering starts from ****0****, not 1.

Procedures

1 Create a Formatted String

```
Console.WriteLine("{0} {1}", "Welcome to", "My workplace");
```

◆ `{0}` is replaced by `"Welcome to"`.

◆ `{1}` is replaced by `"My workplace"`.

2 Use Multiple Values

```
Console.WriteLine(
```

◆ `{0}` → `"Sara"`

◆ `{1}` → `"Sweden"`

3 Use Numbers

◆ Formatted strings can also contain numbers:

```
Console.WriteLine("My age is {0}", 25);
```

💡 Example

```
using System;
namespace Main
{
    internal class Program
    {
        static void Main(string[] args)
        {
            Console.WriteLine("{0} {1}", "Welcome to", "My workplace");
            Console.WriteLine(
                "Hi MyName is: {0} I live in {1}",
                "Sara",
                "Sweden"
            );
            Console.ReadKey();
        }
    }
}
```

🖥️ Output

```
Welcome to My workplace
Hi MyName is: Sara I live in Sweden
```

Note

- ◆ The placeholder number determines which argument is inserted.

```
Console.WriteLine("{0} {1} {2}", "C#", "is", "easy");
```

- ◆ The mapping is:

 `{0}` → `"C#"`

 `{1}` → `"is"`

 `{2}` → `"easy"`

⊘ Warning

⚠ Placeholder numbering starts at ****0****.

`"{0}"` // First value

`"{1}"` // Second value

`"{2}"` // Third value

⚠ Make sure the number of placeholders matches the values you provide.

Comparison

▨ Formatted String

- ✓ Uses placeholders such as `{0}` and `{1}`
- ✓ Values are passed as additional arguments
- ✓ Useful when inserting multiple values into text

▤ String Concatenation

- ✓ Uses `+` to combine strings and values
- ✓ Can become harder to read with many values

✦ Summary

- ✓ Formatted strings use placeholders such as `{0}` , `{1}` , `{2}`
- ✓ `{0}` represents the first value
- ✓ `{1}` represents the second value
- ✓ Values are supplied after the format string
- ✓ Makes output easier to organize and read

Thank you 😊
