

C#

Level 1

switch Statement

C#

Level 1

switch Statement

Definition

switch Statement

-  Used to choose one block of code from multiple possible cases.

-  Often used instead of a long if...else if statement when comparing one value with multiple specific values.

Explanation

case

-  Represents a possible value of the expression.

-  When a case matches, its code is executed.

break

-  Exits the switch after the matching case is executed.

default

-  Executes when none of the cases match.

Grouped Cases

-  Multiple cases can share the same code.

-  Useful when different values should produce the same result.

Procedures

1. Evaluate the switch expression.
2. Compare its value with each case.
3. Execute the matching case.
4. Use break to exit the switch.
5. Execute default if no case matches.

💡 Example

```
char ch = 'A';
```

```
switch (Char.ToLower(ch))  
{  
    case 'a':  
    case 'e':  
    case 'i':  
    case 'o':  
    case 'u':  
        Console.WriteLine("Vowel");  
        break;  
  
    default:  
        Console.WriteLine("Not a vowel");  
        break;  
}
```

➡ Result

Enter a letter?

u

Vowel

Note

- ◆ `Char.ToLower(ch)` converts the character to lowercase.
- ◆ Grouped cases allow several values to execute the same code.
- ◆ `switch` is best suited for comparing one value against specific values.

Comparison

if...else if

- ✓ Better for complex conditions and ranges.
- ✓ Can use conditions such as `>`, `<`, `&&`, and `||`.

switch

- ✓ Cleaner when comparing one value with multiple specific values.
- ✓ Supports grouped cases.

✦ Summary

- ✓ switch selects code based on matching cases.
- ✓ case defines a possible value.
- ✓ break exits the switch.
- ✓ default handles unmatched values.
- ✓ Multiple cases can share the same code.

Thank you 😊
