

C# Level 1 for each Loop

C#

Level 1

for each Loop

Definition

foreach Loop

-  foreach is used to iterate through each element in an array or collection.
-  It accesses elements directly without manually using an index.

💡 Example

```
char[] myArray = { 'H', 'e', 'l', 'l', 'o' };  
Console.WriteLine("Characters in the array:");  
foreach (char ch in myArray)  
{  
    Console.WriteLine(ch);  
}  
Console.ReadKey();
```

➡ Result

Characters in the array:

H

e

l

l

o

Note

- ◆ foreach provides the current element directly.
- ◆ It is mainly used for reading or processing elements.
- ◆ When modifying elements by index, a for loop is often more appropriate.

Comparison

for

- ✓ Uses an index.
- ✓ Accesses elements with `array[index]`.
- ✓ Useful when indexes are needed or elements must be modified by index.

foreach

- ✓ Uses the element directly.
- ✓ No manual index is required.
- ✓ Simpler for reading or processing every element.

✦ Summary

- ✓ foreach iterates through each element in an array or collection.
- ✓ It automatically moves from one element to the next.
- ✓ Syntax: foreach (type variable in collection)
- ✓ for → index.
- ✓ foreach → element.

Thank you 😊
