PictureBox

# Definition

## PictureBox

-  A Windows Forms control used to display images inside a form.
-  Its Image property determines which image is displayed.

# Explanation

## Resources

-  Project images are stored in the application's Resources.
-  Images can be accessed through the Resources class.

## Image Property

-  `pictureBox1.Image` represents the image currently displayed.
-  Assigning a resource image changes the displayed image.

## Procedure

1. Add a PictureBox to the form.
2. Add the required images to the project's Resources.
3. Create a Button Click event.
4. Assign the selected resource image to pictureBox1.Image.
5. The PictureBox displays the selected image.

## 💡 Example

```
private void btnSpiderMan_Click(object sender, EventArgs e)
{
    pictureBox1.Image = Resources.Spiderman;
}
```

### ➡ Result

- ◆ Clicking the Spiderman button:  
    PictureBox → Spiderman image
- ◆ Clicking the Fireman button:  
    PictureBox → Fireman image

## Note

- ◆ Images must be added to the project's Resources first.
- ◆ The resource name must match the name used in the code.

# Comparison

## pictureBox1.Image

- ✓ Specifies the image displayed by the PictureBox.
- ✓ Can be changed at runtime.

## Resources.Spiderman

- ✓ Represents the Spiderman image stored in Resources.
- ✓ Provides the image assigned to the PictureBox.

## ⊘ Warning

- ◆ If the resource name is different, `Resources.Spiderman` will not be available.
- ◆ The Image property can be changed during program execution.

## ✦ Summary

- ✓ PictureBox displays images in a Windows Forms application.
- ✓ Resources provides access to stored project images.
- ✓ Image specifies which image the PictureBox displays.
- ✓ Button Click events can be used to change the displayed image.

Thank you 😊
